

I would like to support RM-10352.

As a ham radio operator since May of 1995, I have found 160 meters to be plagued by problems associated with allowing multimodes over it's entire spectrum.

Since the ARRL volunteer plan, the band has been much more effective for CW and digital modes now that phone transmissions, including SSB and AM modulation, have been segmented above where these modes are voluntarily positioned.

But we need teeth to enforce the volunteer action as there are still disputes over spectrum use resulting in inefficient use. CW needs to have it's own space to allow it to remain the most reliable source of communications on a band often adversely effected by atmospheric conditions making other modes unusable.

Sincerely,
